

COLUMNS DATA

Precast or prestressed columns can provide an economical option to C.I.P. columns for buildings utilizing other precast components. Generally precast columns are best incorporated into structures with other precast components to facilitate a sensible erection schedule and sequencing process.

Projects need to be reviewed on a job by job basis to find the best possible solution.

Standard forms are available for 18" and 24" square columns, but all other sizes and shapes can be accommodated.

Consult Rocky Mountain Precast for more specific design information.
